NAME OF THE PROPERTY OF THE PR
```

The invention describes an isolated PAAD domain containing polypeptide

(I) comprising 80% identity to the amino acid sequence of PAAD and

uncleotide binding protein (PAN) 2-6, pyrin 2, apoptosis-associated speck

like protein containing a caspase recruitment domain (ASC)-2 fully

defined in specification, where (I) is biologically active. (I) is useful

cor identifying a (I)-associated polypeptide, an agent altering that

association and agents that modulate PAAD domain mediated inhibtion of

nuclear factor kappa B (MPKappaB). A NB-ARC domain polypeptide is useful

for identifying an agent that modulates the activity of the NB-ARC domain

of (I). (I) or its functional fragments is useful in altering cellular or

blochemical process such as apoptosis, NPKappaB induction, cytckine

of (I). (I) or its functional fragments is useful in altering cellular or

blochemical process such as apoptosis, NPKappaB induction, cytckine

cor blochemical process such as apoptosis, NPKappaB induction, cytckine

cor blochemical processes. (I) is useful for treating cancer pathologies,

cor blochemical processes. (I) is useful for treating cancer pathologies,

cor blochemical processes. (I) is useful for treating cancer pathologies,

cor blochemical processes. (I) is useful for disagness such as allergies arthritis,

broliferation in arteries following balloon angioplasty (restenosis),

cor blocks, schrojen's syndrome, Crohn's disease such as allergies, arthritis,

lupus, schrojen's and Alzheimer's disease human immunodeficiency virus

infection (HIV). (I) is useful for diagnosing cancer or monitoring cancer

therapy. This is the amino acid sequence of a human immunodeficiency virus

binding protein PANG.

The invention comprises the amino acid and coding sequences of human PYRIN proteins. The PYRIN protein and DNA sequences of the invention are useful for modulating and diagnosing stress-related, apportoric and inflammatory responses. The PYRIN protein and DNA sequences are useful for treating: inflammatory disorders and immune system disorders (e.g. for treating: inflammatory disorders and immune system disorders (e.g. crohn's disease, reactive arthritis, multiple sclerosis, contact dermatitis, psoriasis, graft rejection, allergies, viral infections and bacterial infections); cancer (e.g. leukaemia); autoimmune disorders (e.g. systemic lupus erythematosus and arthritis); and neurological diseases (e.g. Alzheimer's disease and Parkinson's disease). The PYRIN protein and DNA sequences may also be used in screening assays, detection assays (e.g. chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic assays, clinical trials and charactiption profiling. The present amino acid sequence represents a human PYRIN-8 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ---DPQETYRDYVRRKFRLMEDRNARLGECVNLSHRYTRLLLVKEHSNPMQVQQLLDTG 153

```
The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, sarcoidosis, glomerulonephritis and osteoarthritis, and also Alzheimer's and Parkinson's diseases. The present sequence is a protein of the
New DNA encoding protein with pyrin domain, useful for treating diseases involving impaired signal transduction, particularly inflammation, also proteins and antibodies.
                                                                                                               Claim 5; Fig 1; 116pp; German.

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention, and methods of polynucleotides or polypeptides of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or

ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 (ADC31861-ADC32527) and the polynucleotide and/or polypeptide; and 767 (ADC31861-ADC32527) and the polynpeptides encoded by the invention or entering and polypeptides of the invention are about in diagnostics, drug screening, forensics, gene mapping, in the caseful in diagnostics, drug screening, forensics, gene mapping, in the candent of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alaheimer's disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or disorders, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and an in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and an electronic form sequence represents a specifically claimed human polypeptide sequence of the invention. ```
The invention describes an isolated PAAD domain containing polypeptide (I) comprising 80% identity to the amino acid sequence of PAAD and nucleotide binding protein (PAN) 2-6, pyrin 2, apoptocis-sascoiated speck like protein containing a caspase recruitment domain (ASC)-2 fully defined in specification, where (I) is biologically active. (I) is useful correlation and agents that modulate PAAD domain mediated inhibtion of muclear factor kappa B (NFKappaB). A NB-ARC domain polypeptide is useful association and agents that modulates the activity of the NB-ARC domain of (I). (I) or its functional fragments is useful in altering that corresponding to the transport of (I). (I) or its functional fragments is useful in altering cellular or biochemical process such as apoptoais, NFKappaB induction, cytckine of (I). (I) or its function, thus having modulating cellular or biochemical process such as apoptoais, NFKappaB induction, cytckine or coloremical process such as apoptoais, the avenuation or other cellular or biochemical processes. (I) is useful for treating cancer pathologies, keratinocyte, hyperplasia, neoplasia, fibrosis, smooth muscle cell or biochemical processes. (I) is useful for treating cancer pathologies, correction in arteries following balloon angioplasty (restenosis), corrections short disease, stroke, heart failure, neurodegenerative diseases such as aparkinson's stroke, heart failure, neurodegenerative diseases such as aparkinson's and Alzheimer's disease human immunodeficiency virus infection (HIV). (I) is useful for diagnosing cancer or monitoring cancer therapy. This is the amino acid sequence of a human pAAD and nucleotide binding protein PANG leucine-rich-repeat domain (LLR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        429 PNORGLCSLAADGLWNOKILFEEQDLRKHGLDGEDVSAFLNWNIFQKDINCERYYSFIHL 488
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

The invention describes an isolated polypeptide (I) comprising any of 27 (18-961 residue amino acid sequences, given in the specification, a mature form of them, a sequence that is at least 95 % identical to them, or a sequence having one or more conservative substitutions in them. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease selected from a pathology associated with the polypeptide. The NOVX polypeptides, polymelectides and antibodies are useful in treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, cancer. diabetes, immune disease, Alzheimer's disease, infections, multiple sclerosis, cancer cassociated cachexia, and other wasting disorders associated with chronic diseases. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. currogenesis, cell differentiation, cell proliferation, haematopoiesis, continuodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as therapeutic or diagnostic methods. The nucleic acids are further used as the polypeptides are also useful as vaccines. This is the amino acid sequence of a novel human G-protein correction coupled receptor related protein NOV treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis, or diabetes, and in chromosome mapping, tissue typing or New NOVX polypeptides and nucleic acids, useful for preventing or Claim 1; Page 99; 332pp; English pharmacogenomics.

New human nucleic acid-associated proteins (NAAP), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant NAAP expression, e.g. cancer, hepatitis, AIDS, atherosclerosis, infections.

Claim 1; Page 147-149; 162pp; English.

The invention relates to an isolated polypeptide comprising one of 10 human nucleic acid associated protein (NAAP1-10), or a biologically active or immunogenic fragment of the polypeptide, and their encoding nucleic acid. Also included are a recombinant polynucleotide comprising a promoter sequence operably linked to the polynucleotide, a call transformed with the recombinant polynucleotide, a transgenic organism comprising the recombinant polynucleotide, an anti-NAAP antibody, screening for a compound that is effective as an anti-NAAP antibody. oligomucleotide or polymucleotide sequence specifically hybridisable with at least 30 contiguous nucleotides of the target (NAAP) polymucleotide. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of NAAP, such as cell proliferative diseases (e.g. cancer, atherosclerosis, hepatitis), neurological disorders of NAAP, generating an expression profile of a sample containing the polynuclectides and an array comprising different nucleotide molecules affixed on a solid substrate, nucleotide molecule comprises a first

```
(Parkinson's disease, Alzheimer's disease, stroke, epilepsy), developmental disorders (renal tubular acidosis, anaemia, glaucoma, developmental disorders (renal tubular acidosis, anaemia, glaucoma, phypothyrodism), autoimune/inflammatory disorders (AIDS (acquired immunodeficiency syndrome), allergies, atopic dermatitis, arthritis) and infections (e.g. bacterial, viral, parasitic, protozoal, fungal) and many other diseases and disorders listed in the specification. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of MAAP. The NAAP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide. The microarray is useful in monitoring or masuring protein interactions, and or masuring protein interactions, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WLDSCGLTAKACENLYFTLGINOTLTDLYLTNNALGDTGVRLLCKRLSHPGCKLRVLWLF 1009

The invention describes an isolated polypeptide (I) comprising any of 27 118-951 residue amino acid sequences, given in the specification, a mature form of them, a sequence that is at least 95 # identical to them, or a sequence having one or more conservative substitutions in them. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease selected from a pathology associated with the polypeptide. The NOWX polypeptides, polynucleorides and antibodies are useful in treating or preventing NOWX-associated disorders, HIDS, obesity, asthma, haematopoicies, cancer, diabetes, immune disease, e.g. cardiomyopathy, atherosclerosis, cancer, diabetes, immune disease, Alzheimer's disease, infections, multiple sclerosis, cancer-associated cachexia, and other wasting disorders associated with chronic diseases. The nucleic acide and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, heamatopoiesis, wound healing and angiogenesis, in gene therapy, in generation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Baumgartner JC, Boldog FL, Casman SJ, Edinger SR; Gerlach VL, Gorman L, Guo X, Hjalt T, Kekuda R, Li Li, Malyankar UM, Millet I, Padigaru M, Patturajan M; stelli L, Shimkets RA, Stone DJ, Spytek RA, Vernet CAM;

The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive madicine, and pharmacogenomics. The polypeptides are also useful as vaccines. This is the amino acid sequence of a novel human G-protein coupled receptor related protein NOV
                                                                                                                                                                                                                                                                                                                                                                                                                9

```
The invention relates to human NBS-1 (nucleotide binding site) and PYRIN-
1 protein and nucleic acids. NBS-1 and PYRIN-1 DNA, protein and their
modulators are useful in the treatment of apoptotic and inflammatory
condisorders, cancer (leukaemia, melanoma, carcinoma); viral infections
(including herpesvirus and adenovirus), autoimmune diseases (systemic
Lupus erythematosus (SLE), immune-mediated glomerulomephitis, arthritis)
; neurological disorders (Alzheiner's disease, Parkinson's disease,
amyotrophic lateral sclerosis (ALS), retinitis pigmentosa, Huntington's
disease); aplastic anaemia, isohaemia, meningitis, liver diseases. NBS-1
and PYRIN-1 DNA, protein and their modulators are also used for the
treatment of inflammatory and immune disorders such as chronic
inflammatory diseases such as Crohn's disease, insulin-dependent
cinflammatory diseases such as Crohn's disease, insulin-dependent
cinflammatory also asthma, HIV, tuberculosis and lepromatous
crossor, The present sequence is human PYRIN-1 protein
                                                                                                    Novel polypeptide comprising NBS-1 or PYRIN-1 of the pyrin domain protein family useful in screening and detection assays and for treating, e.g., cancer, viral infections, autoimmune disease, and Alzheimer's.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     244 GTLYQDRFDYLFYIHCREVS-LVTQRSLGDLIMSCCPDPNPPIHKIVRKPSRILFLMDGF 302

compound on the activity of PYRIN-1. In a similar manner, compounds are compound and determining whether compound on the activity of PYRIN-1. In a similar manner, compounds are isolated which modulate the binding of PYRIN-1 to ASC (comprising testing the compounds against the pyrin binding domains of both PYRIN-1 and ASC (not defined)), modulate the binding of PYRIN-1 to ASC (comprising testing the compounds against the pyrin binding domains of both PYRIN-1 and ASC (not defined)), modulate the activity of NR-kB (nuclear factor KB), and which modulate the ASC-mediated activation of NR-kB (comprising: (a) measuring the binding of a test compound to the LRR (leucine rich repeat) comain of PYRIN-1; and (b) measuring the activitation of NR-kB in a cell cappressing ASC and PYRIN-1 in the presence and absence of the LRR domain conformatory disorder. Also included is a method (MB) for identifying a modulator of caspase-1 activity. The identified compound can be used to modulate the polypeptide's activity (ASC and NF-kB activities in a conformatory disorders associated with inappropriate apoptosis (inflammatory disorders e.g. familial cold urticaria, arthritis, conformatory disorders e.g. familial cold urticaria, arthritis, conformatory disorders associated with inappropriate apoptosis (inflammatory bowel disease, contact dermatitis, psoriasis, graft versus contact dermaticis, psoriasis, graft versus contact dermaticis, psoriasis, graft versus contact stopendent diabetes, multiple conference such as tuberculosis and leprosy) can be treated. Human NHCH represent multiple conference containing the PYRIN-1 gene. The corporator functions such as HIV infection, and bacterial conference containing the PYRIN-1 gene. The corporator propression characted on chromosome 1444. The present sequence
                                                                                                                                                                                                                                    The invention relates to a new method for the identification of a compound that binds to a human PYRIN-1 (an apoptotic signalling molecule appearing as ABU08503) comprising contacting the polypeptide or a cell
                                                        Identification of compound that binds to polypeptide (for e.g. a PYRIN protein), useful for treating disorders associated with inappropriate
                                                                                    protein), useful for treating disorders as apoptosis, for e.g. inflammatory disorder.
                                                                                                                                                                               Claim 1, Fig 4; 74pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gene for pyrin-1 is locat

The present sequence represents a human leucine-rich repeat containing protein, designated HLRRBMI. HLRRBMI polypeptides and polynucleotides are protein, designated HLRRBMI. HLRRBMI polypeptides and polynucleotides are proliferative disorder, immune condition, or a disorder related to as a proliferative disorder, immune condition, or a disorder related to aberrant apoptosis modulation, either directly or indirectly, and in conganisms. They are also useful for treating, preventing, or diagnosing diseases of hematopoietic cells, autoimmune disease, graft-versus-host diseases, allergic conditions (e.g. asthma), cardiovascular disorders, and neurological diseases, and for increasing the organisms ability to synthesize and/or release pheromenes. The polypeptide may also be used in treating, preventing or ameliorating pulmonary disease (e.g. chronic obstructive pulmonary disease, allergic rhinitis, or bronchial chyperresponsiveness), reproductive disease, haematopoietic disease, platelet disorders (e.g. Bernard-Soulier syndrome), non-infectious immune response), immune and inflammatory disorders (e.g. systemic lupus crythematosus), cardiovascular diseases and cancers. HIRRBMI nucleic acids may further be used in chromosome identification or mapping, as a chromosome marker, as molecular weight markers, as diagnostic probes, in continuing immune responses

Novel isolated PAAD domain containing polypeptide useful for inducing apoptosis by inhibiting nuclear factor kappa B activation and in gene therapy for treating cancer.

Disclosure; SEQ ID NO 59; 93pp; English.

The invention describes an isolated PAAD domain containing polypeptide (I) comprising 80% identity to the amino acid sequence of PAAD and nucleotide binding protein (PAN) 2-6, pyrin 2, apoptosis-associated speck-like protein containing a caspase recruitment domain (ASC)-2 fully defined in specification, where (I) is biologically active. (I) is useful for identifying a (I)-associated polypeptide, an agent altering that association and agents that modulate PAAD domain mediated inhibtion of nuclear factor kappa B (NPKappaB). A NB-ARC domain polypeptide is useful for identifying an agent that modulates the activity of the NB-ARC domain of (I) or its functional fragments is useful in altering cellular or biochemical process such as apoptosis, NPKappaB induction, cytokine processing, cytokine receptor signaling caspase-mediated proteolysis or c

Jun N-terminal kinase activation, thus having modulating effect on cell life and death (apoptosis) inflammation, cell adhesion or other cellular or biochemical processes. (I) is useful for treating cancer pathologies, keratinocyte, hyperplasia, neoplasia, keloid benign prostatic hypertrophy, inflammatory hyperplasia, fibrosis, smooth muscle cell proliferation in arteries following balloon angioplasty (restenosis), leukaemia, lymphomas; inflammatory diseases such as allergies, arthritis, lupus, schrojen's syndrome, Crohn's disease and ulcerative colitis, graft versus host disease, stroke, heart failure, neurodegenerative diseases such as parkinson's and Alzheimer's diseases human immunodeficiency virus infection (HIV). (I) is useful for diagnosing cancer or monitoring cancer therapy. This is the amino acid sequence of human PAAD domain associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           135
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           470
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        471 SLAADGIWNQKILFEESDLRNHGLQKADVSAFLRMNLFQKEVDCEKFYSFIHMTFQEFFA 530

The invention comprises the amino acid and coding sequences of human PYRIN proteins. The PYRIN protein and DNA sequences of the invention are useful for modulating and diagnosing stress-related, apoptopic and inflammatory responses. The PYRIN protein and DNA sequences are useful for treating: inflammatory disorders and immune system disorders (e.g. crohn's disease, reactive arkhritis, multiple solerosis, contact dermatitis, psoriasis, graft rejection, allergies, viral infections and bacterial infections; cancer (e.g. leukaemia); autoimmune disorders (e.g. systemic lupus erythematosus and arthritis); and neurological diseases (e.g. Alzheimer's disease and Parkinson's disease). The PYRIN protein and DNA sequences many also be used in screening assays, detection sasays (e.g. chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic assays, clinical trials and charmacogenomics) and transcription profiling. The present amino acid sequence represents the human PYRIN-3 protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel genes which are upregulated by mitric oxide (NO), designated as rno and their corresponding proteins. The invention also relates to the isolation and characterisation of three isolorms of rno gene, rno-1, rno-3. rno proteins of the invention are useful for inducing differentiation and death in a cancer cellosquosing acute myeloid leukaemia (AML) comprises detecting the expression of a rho gene comprising the nucleotides coding for rno protein. The present sequence is rno-1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       829
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    138
